

SCHOOL MANAGEMENT

Adverse Childhood Experiences (ACE) and Trauma Informed Schools

In the United States and Britain a new wave of awareness of childhood trauma is sweeping through schools in the shape of the Trauma Informed Schools movement, and we can expect that Australia will follow this trend.

DR NEIL MACNEILL, PRINCIPAL, CHAIRPERSON VETERANS' CHILDREN'S EDUCATION BOARD (WA)
APR 11, 2021

Childhood trauma needs to be monitored

The true scale of the impact of trauma on the students in our schools is sadly under-estimated, and, in reality, the school staff members often only ever see the tip of the iceberg because many traumatised students have often been taught never to reveal what happens in homes and family situations. In the United States and Britain a new wave of awareness of childhood trauma is sweeping through schools in the shape of the Trauma Informed Schools movement, and we can expect that Australia will follow this trend.

Awareness of childhood trauma is often discussed by school staff who are concerned about the impact on their students. In 1998, Felitti, et al. had coined the term Adverse Childhood Experiences (ACE) to describe these traumatic experiences traumatised children had faced. Furthermore, these authors found that '(b)ecause adverse childhood experiences are common and they have strong long-term associations with adult health risk behaviors, health status, and diseases, increased attention to primary, secondary, and tertiary prevention strategies is needed' (p. 254). To help quantify the ACE data Felitti, et al. (1998) developed the ACE survey and the data for Adverse Childhood Experiences survey revealed the dimensions of this issue, with the American data (Sacks, Murphey & Moore, 2014, p. 1) claiming that 46% of American children have experienced an ACE.

The eight ACEs that were measured in Felitti's original research included:

- 1 Lived with a parent or guardian who got divorced or separated
- 2 Lived with a parent or guardian who died

- 3 Lived with a parent or guardian who served time in jail or prison
- 4 Lived with anyone who was mentally ill or suicidal, or severely depressed for more than a couple of weeks
- 5 Lived with anyone who had a problem with alcohol or drugs
- 6 Witnessed a parent, guardian, or other adult in the household behaving violently toward another (e.g., slapping, hitting, kicking, punching, or beating each other up)
- 7 Was ever the victim of violence or witnessed any violence in his or her neighborhood
- 8 Experienced economic hardship 'somewhat often' or 'very often' (i.e., the family found it hard to cover costs of food and housing). (Sacks, Murphey & Moore, 2014, p. 2).

Romero, Robertson and Warner (2018, p. 3) viewed ACE as an equal opportunity occurrence with some 60% of one research sample indicating that they had directly or indirectly been exposed to ACE. However, the interface between ACE and trauma is pertinent in the school environment because of its impact on students' learning.

It is important to acknowledge that the ACE instrument was developed by medical doctors examining aspects of preventative medicine. The prestigious CDC Centres (Centers for Disease Control and Prevention in the United States) developed the ACE Pyramid from this research (Figure 1), which is designed to show the linkage between ACE and the quality of life and death (2014). Teachers too often hypothesise about the impact of ACE on students' education and their future lives.

Figure 1. The ACE Pyramid. (Centers for Disease Control and Prevention, 2014)

In education, there is now a growing body of research in relation to the effect of trauma on students' learning. The ACE construct will help schools to better understand their students, and then shape Individual Education Programs (IEPs)

and Trauma Informed School cultures to support their students' learning.

ACE survey

The Kaiser ACE survey has 10 items that fall within the three categories of abuse, neglect, and household dysfunction (Table 1).

Abuse	Neglect	Household Dysfunction
1 (physical)	4 (physical)	6 (Divorce)
2 (emotional)	5 (physical/emotional)	7 (Mum treated violently)
3 (sexual)		8 (substance abuse)
		9 (Mental illness)
		10 (incarcerated relative)

Table 1. Summary of Kaiser ACE Survey

Adverse Childhood Experience (ACE) Survey (Philadelphia revision)
<p>1 Emotional Abuse</p> <p>While you were growing up how often did a parent, step-parent, or another adult living in your home swear at you, insult you, or put you down? More than once, once, never While you were growing up how often did a parent, step-parent, or another adult living in your home act in a way that made you afraid that you would be physically hurt? More than once, once, never</p>
<p>2 Physical Abuse</p> <p>While you were growing up did a parent, step-parent, or another adult living in your home push, grab, shove, or slap you? More than once, once, never While you were growing up did a parent, step-parent, or another adult living in your home hit you so hard that you had marks or were injured? More than once, once, never</p>
<p>3 Sexual Abuse</p> <p>During the first 18 years of life, did an adult or older relative, family friend, or stranger who was at least five years older than yourself ever touch or fondle you in a sexual way or have you touch their body in a sexual way? Yes or No Attempt to have or actually have any type of sexual intercourse, oral, anal or vaginal with you? Yes or No</p>
<p>4 Emotional Neglect</p> <p>There was someone in your life who helped you feel important or special. Very often true, often true, sometimes true, rarely true, never true</p>
<p>5 Physical Neglect</p> <p>Your family sometimes cut the size of meals or skipped meals because there was not enough money in the budget for food. Very often true, often true, sometimes true, rarely true, never true</p>
<p>6 Domestic Violence</p> <p>How often, if ever, did you see or hear in your home a parent, step-parent, or another adult who was helping to raise you being slapped, kicked, punched, or beaten up? Many times, a few times, once, never How often, if ever, did you see or hear in your home a parent, step parent, or another adult who was helping to raise you being hit or cut with an object, such as a stick, cane, bottle, club, knife or gun? Many times, a few times, once, never</p>
<p>7 Household Substance Abuse</p> <p>While you were growing up, did you live with anyone who was depressed or mentally ill? Yes or No Did you live with anyone who was suicidal? Yes or No</p>
<p>8 Parental Separation Not asked in this revision.</p>
<p>9 Incarcerated Household Member</p> <p>Did you live with anyone who served time or was sentenced to serve time in a prison, jail, or other correctional facility? Yes or No</p>
<p>Expanded ACE</p>

<p>10 Witness violence</p> <p>How often, if ever, did you see or hear someone being beaten up, stabbed, or shot in real life? Many times, a few times, once, never Not asked Felt Discrimination</p>
<p>11 Felt Discrimination</p> <p>While you were growing up...How often did you feel that you were treated badly or unfairly because of your race or ethnicity? Very often true, often true, sometimes true, rarely true, never true</p>
<p>12 Adverse Neighborhood experience</p> <p>Did you feel safe in your neighborhood? All of the time, most of the time, some of the time, none of the time Did you feel people in your neighborhood looked out for each other, stood up for each other, and could be trusted? All of the time, most, some, none of the time</p>
<p>13 Bullied</p> <p>How often were you bullied by a peer or classmate? All of the time, most of the time, some of the time, none of the time</p>
<p>14 Lived in foster care</p> <p>Were you ever in foster care? Yes or No</p>

Table 2. Adverse Childhood Experience (ACE) Survey (Philadelphia revision, Cronholm et al. 2015)

However, more recent development of ACE that was trialled in Pennsylvania by Cronholm, et al. (2015) further developed the original ACE scale to measure a wider socio-demographic sample. The authors claimed the extended instrument picked up an extra 13.9% of the sample who would not have been identified in the earlier Kaiser ACE survey.

ACE Awareness and Trauma

Informed Schools

The original research that developed the concept of Abusive Childhood Experiences is now over two decades old. But what we can now see is that schools and school systems are becoming more aware of the ACE research and survey as they address student trauma. ACE Response (2019) stated that:

'Teachers, school administrators, parents, and others within and beyond the education sector are teaming up to create healthy and supportive school environments that promote the academic success of all students. Schools like Cherokee Point Elementary School in San Diego, California and Lincoln High School in Walla Walla, Washington are applying trauma-informed methods to help make their kids feel safe, connected, and ready to learn.'

Tamara Fyke (2018) confirmed that the new interest in ACE is a result of mental health and resilience development in schools, and the growth of the trauma informed school movement in the United States.

Schools in Britain are now increasingly using the ACE survey and Lauren Smith (2018) reported that '... references to adverse childhood experiences have increased tenfold at a steady pace, suggesting a significant growth in discourse around the concept.'

Transmitted trauma and ACE

While the American ACE research mainly concentrates on direct, violent acts, in contrast, transmitted trauma is often overlooked in busy schools because its causes are often historic, and it is deeply embedded in family narratives. In Australian schools the transmission of trauma on Jewish families that survived the Holocaust is well acknowledged, but it often falls outside the domain of responsibility for school psychologists in public schools. Less understood is the raw transmission of Indigenous trauma. The Stolen Generation is reasonably well documented, but the embedded trauma for children in some communities is overwhelmingly traumatic and it requires multi-agency action. Atkinson's (2008) research of Aboriginal families showed:

'... that the normalisation of family violence and the high prevalence of grief, loss and substance misuse were as

much symptoms as causes of traumatic stress. One of the most alarming aspects of Atkinson's study was the consistency of identifying as being victims of particularly severe child sexual abuse from early ages. This abuse, which often began in early childhood (victim) and continued until maturity, triggered the later acting out (perpetrator) on members of extended family and others. Atkinson's research also identified a substantial lack of services that effectively supported victims of abuse and interrupted its intergenerational progression. Atkinson concluded that the link between childhood trauma and adult offending was mediated by the presence of unresolved trauma and undiagnosed PTSD' (Atkinson, Nelson & Atkinson, 2010, p. 137).

The influx of refugees into Australia from areas of conflict has also given another dimension to the trauma issues in our schools.

Conclusion

Schools are expected to be safe places for students, and we transmit that value daily by dealing fairly with students and addressing issues such as bullying in a timely manner. Trauma continues to be the elephant in the room for school staff, and the ramifications of this issue are so complex that school staff often act as first responders, and then coordinate their school's responses to other lead agencies.

The ACE research is vital because it links schooling, students' health, and their adult health and quality of life prospects. For Australian schools this is really important, and we can view the brilliant TED Talks that support our awareness building:

https://www.ted.com/talks/nadine_burke_harris_how_childhood_trauma_affects_health_across_a_lifetime

<https://www.youtube.com/watch?v=cckFkcfXx-c>

It is timely to remember that in schools we receive information about students, but don't actively investigate this area because other agencies have jurisdiction. Our guide for action in this domain is always: listen and then ask for help from authorised agencies.

The Adverse Childhood Experiences survey is not a clinical or precise instrument because it is a summary, or an overview that is designed to quantify the range of adverse childhood experiences. When the ACE data is made available to schools its use can be a key part of amelioration actions as schools develop plans to build Trauma Informed Schools, which is the way of the future.
